BACKTEST REPORT · OCTOBER 2026

BB Breakout on SOL, ZEC, NEAR, ADA and GALA

A 2020–2026, month-by-month look at one 4-hour Bollinger-band trend strategy — how it made and lost money in every market regime since 2020, and whether it is worth trading.

NET PROFIT, 2020–26	TRADES	AVERAGE TRADE	WORST DRAWDOWN	HELD-OUT 2023 → 2026	PROFITABLE COIN-YEARS
+$2479	**1,508**	**+0.33R**	**−$128**	**+$1345**	**34 of 34**
at $5 risk per trade · all 5 coins	39% winners	profit factor 1.57	all 5 coins combined	years never used for tuning	0 flat, 0 losing (none)

Cumulative profit at $5 risk per trade

Closed-trade profit, booked when each trade exits. Fixed $5 risk per trade (no compounding). Binance fees, slippage and real funding included.

The short answer

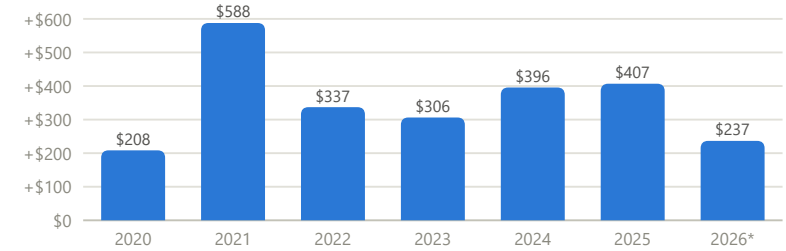

Recommended — with modest expectations. The strategy made money on all 5 coins over 2020–2026 after realistic costs, including on ZEC, NEAR, ADA, GALA (never used for tuning) and in 2023–26 (never used for tuning).

It wins by catching a few large, clean moves — up *or* down — and loses slowly in sideways markets. It does not adapt to regimes; it survives them because losses are small and capped.

Start all 5 at equal size, GALA smaller. GALA has a strong edge on paper but the shortest history (from Sep 2021), a thin market, and all of its profit comes from short trades. NEAR has the smallest edge per trade.

Expect long losing streaks (7–9 trades per coin, 20 across all 5), only ~39% winners, and roughly $5.9 a month at $1 risk across the 5 coins.

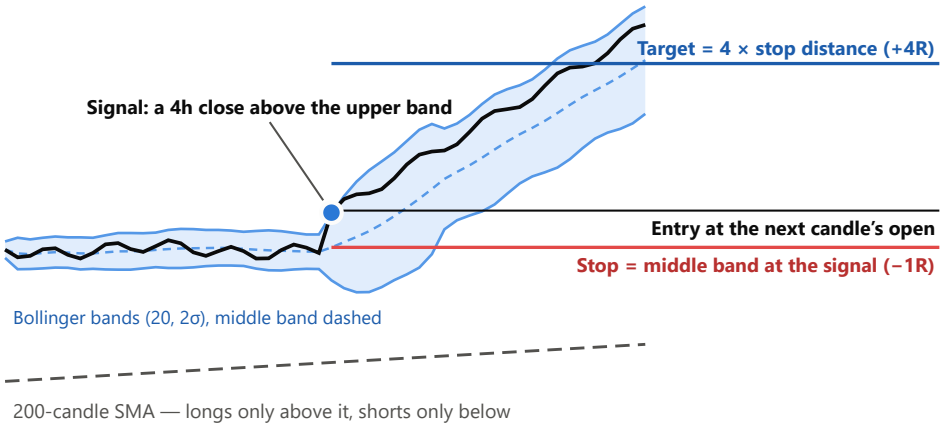

Net profit each year, all 5 coins ($)

*2026 to mid-October. 7 of 7 years were profitable.

1 · How the strategy works and how it was tested

The rules (frozen — not changed for this report)

- **Long:** a 4h candle closes above the upper Bollinger band (20 candles, 2σ) *and* above the 200-candle SMA.
- **Short:** a close below the lower band *and* below the SMA.
- **Stop** = the middle band at the signal close · **Target** = 4× the stop distance · **Time exit** after 48 candles (8 days).
- One trade at a time per coin; no pyramiding; no discretion.

Realism: what the backtest charges and assumes

Item	Assumption
Data	Binance USDT-M perpetual futures, 4h candles. SOL from Sep 2020, ZEC from Feb 2020, NEAR from Oct 2020, ADA from Jan 2020, GALA from Sep 2021 (listing dates), all to 17–20 Oct 2026.
Decision	Only at a candle's close, using only candles already closed. The bot never sees the next candle.
Entry fill	Next candle's open + 0.02% slippage + 0.05% taker fee.
Stop / time exit	Market order: 0.02% slippage + 0.05% taker fee. Gaps through the stop fill at the worse open price.
Target	Resting limit (0.02% maker fee) — fills only if price trades 0.05% *through* it.
Same-candle stop & target	Counted as a stop (worse case). Happened 1 time(s) in 1,508 trades.
Funding	Real Binance funding paid or received at every 8h event the trade was open through.
Sizing	Fixed $5 risk per trade on a notional $1,000 account per coin. Equity = $1,000 + cumulative profit.

No look-ahead, no repainting — checked

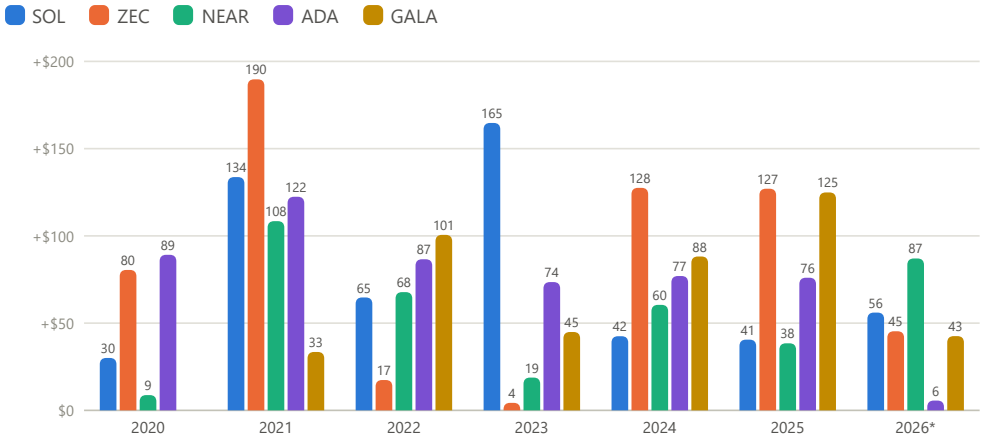

Coin	Truncation cuts	Orders compared	Mismatches	Bot vs app engine
SOL	100	30,682	**0**	308 / 308 identical
ZEC	100	35,260	**0**	332 / 332 identical
NEAR	100	30,140	**0**	297 / 297 identical
ADA	100	27,357	**0**	328 / 328 identical
GALA	100	23,556	**0**	243 / 243 identical

The engine was re-run on data cut at 100 random points per coin; every decision before each cut matched the full-history run, so no future candle is ever used. A second, independently written bot matches the app engine trade for trade.

Tuning status. Bollinger / SMA / stop / time-exit settings were chosen on 2019–22 BTC, ETH and SOL and then frozen. **2023→2026 and every coin except SOL (ZEC, NEAR, ADA, GALA) are out-of-sample.** The 4R target was chosen after comparing 3R/4R/5R on all years, so it is mildly in-sample. **Coin choice is also hindsight:** these 5 were picked from roughly 100 coins screened because they did best (BTC, in the earlier version of this report, was dropped for its weaker, less consistent results), so treat the totals as an optimistic estimate.

2 · 2020–2026 at a glance

Net profit by year and coin ($, at $5 risk)

*2026 to mid-October. Trades are counted in the year they close. GALA from Sep 2021.

Year	SOL	ZEC	NEAR	ADA	GALA	All 5	BTC buy-and-hold
2020	+$30	+$80	+$9	+$89	·	**+$208**	+303%

2025	**8** (−$41)	**5** (−$26)	**6** (−$26)	**4** (−$20)	**3** (−$11)	**14** (−$71)
2026*	**6** (−$31)	**7** (−$36)	**5** (−$26)	**7** (−$34)	**6** (−$27)	**13** (−$67)
Whole period	**8** (−$33)	**9** (−$43)	**7** (−$32)	**9** (−$46)	**9** (−$44)	**20** (−$101)

A losing trade is any trade that closed at or below zero. The combined column counts consecutive losses across all coins in the order trades closed. *2026 to mid-October.

The 5 deepest drawdowns, all 5 coins combined

Peak → trough	Depth	Trades down	Recovered
2022-06-20 → 2022-11-08	−$128	133	2023-01-09 (203 d)
2023-03-11 → 2023-05-04	−$121	67	2023-06-10 (91 d)
2026-02-09 → 2026-05-05	−$115	72	2026-05-21 (102 d)
2023-12-24 → 2024-01-19	−$93	42	2024-02-19 (58 d)
2025-12-01 → 2026-01-01	−$82	46	2026-02-05 (66 d)

Closed-trade profit from a peak to the lowest point before a new peak. At $1 risk divide the dollars by 5.

The 5 longest losing streaks, all 5 coins combined

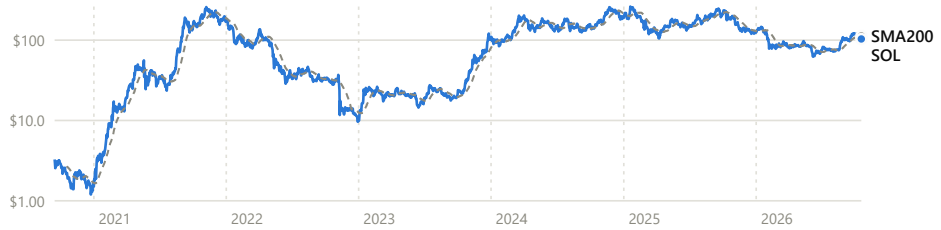

Losses in a row	From → to	Cost
20	2022-10-20 → 2022-11-08	−$101
14	2025-12-01 → 2025-12-11	−$71
13	2026-09-27 → 2026-10-08	−$67
12	2022-09-23 → 2022-10-07	−$58
12	2023-02-02 → 2023-02-21	−$48

Counts consecutive losing trades across all coins in the order they closed. Several coins can lose in the same few days, so a combined streak is longer than any single coin's.

*2026 to mid-October. 45 of 74 months profitable. Regime labels are measured from the candles: trend efficiency = net move ÷ distance travelled (1 = straight line).

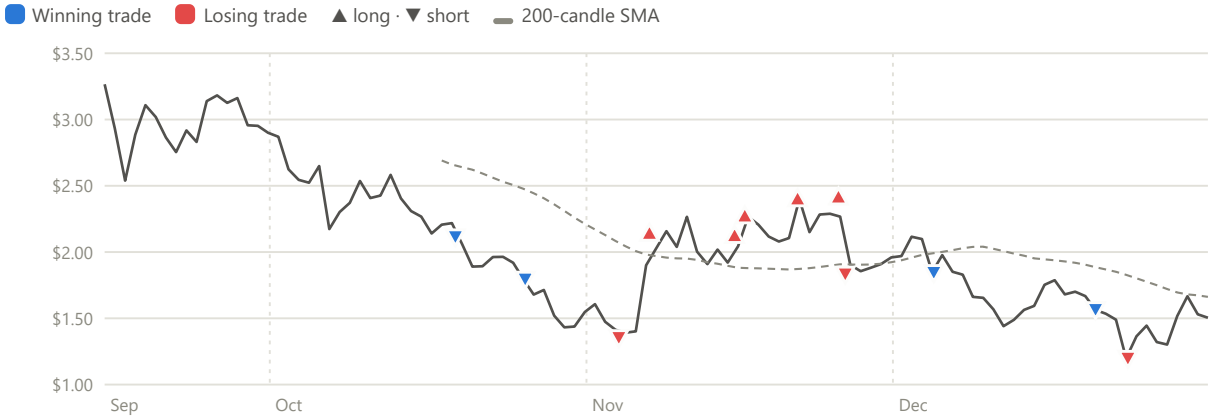

SOLANA (SOL)

2020 (from listing in Sep)

Strong downtrend · high volatility

NET	TRADES	WIN RATE	AVG TRADE	MAX DRAWDOWN	LOSING STREAK	COIN MOVE
+$30	**12**	**33%**	**+0.50R**	**−$28**	**7**	**−55%**
$1,000 → $1,030	4 W · 8 L	2 hit the 4R target	PF 1.91	within the year	longest, in trades	volatility 146%

SOL price with every trade entry

How the market behaved

Strong downtrend · high volatility. SOL went from $3.27 to $1.50 (−55%) with annualised volatility of 146% (its typical month: 96%). Trend efficiency of 0.45 means a clean, persistent trend. Price was above its 200-candle SMA 22% of the time and crossed it 16 times; the deepest peak-to-trough fall inside the year was −58%.

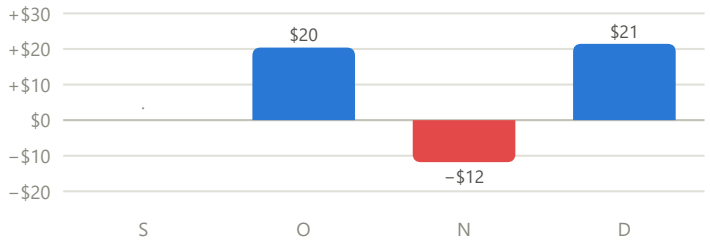

Biggest month up: **Nov** (+27%); biggest month down: **Oct** (−47%).

Backdrop: COVID crash in March (BTC fell ~50% in two days), the May halving, then an institution-led rally from October into year-end.

Month by month

Month	Coin	Regime	Trades	W/L	Win %	Net	Avg	PF	Max DD	Streak	Start eq.	End eq.
Sep	−14%	Choppy, high vol	·			·					$1,000	$1,000
Oct	−47%	Trend down, high vol	1	1/0	100%	**+$20**	+4.08R	∞	$0	0	$1,000	$1,020
Nov	+27%	Choppy, high vol	7	1/6	14%	**−$12**	−0.34R	0.54	−$26	6	$1,020	$1,009
Dec	−23%	Drift down, high vol	4	2/2	50%	**+$21**	+1.07R	3.99	−$5	1	$1,009	$1,030
Year	−55%		12	4/8	33%	**+$30**	+0.50R	1.91	−$28	7	$1,000	$1,030

Monthly net ($)

How the strategy did — and why

12 trades, 4 winners (33%), net **+$30** — +0.50R per trade, profit factor 1.91. 2 of 3 trading months were profitable.

Every month moved at least 10%, and the 3 months with a 15%+ move made +$30 — plenty of movement for a breakout strategy.

Best month **Dec** (+$21); worst **Nov** (−$12). Longest losing streak: **7** (4 Nov 2020 → 4 Dec 2020, −$28). Max drawdown −$28.

Longs −$21 · shorts +$51. Exits: 2 targets, 6 stops, 4 time exits (averaging +1.02R).

SOLANA (SOL)

2021

Strong uptrend · high volatility

NET	TRADES	WIN RATE	AVG TRADE	MAX DRAWDOWN	LOSING STREAK	COIN MOVE
+$134	**54**	**41%**	**+0.50R**	**−$36**	**5**	**+11,200%**
$1,030 → $1,164	22 W · 32 L	12 hit the 4R target	PF 1.84	within the year	longest, in trades	volatility 173%

SOL price (log scale) with every trade entry

How the market behaved

Strong uptrend · high volatility. SOL went from $1.84 to $170 (+11,200%) with annualised volatility of 173% (its typical month: 96%). Trend efficiency of 0.35 means a fairly directional path. Price was above its 200-candle SMA 71% of the time and crossed it 70 times; the deepest peak-to-trough fall inside the year was −67%.

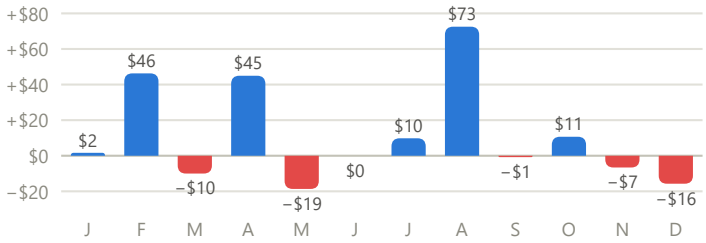

Biggest month up: **Feb** (+207%); biggest month down: **May** (−24%).

Backdrop: Bull-market peak year: a run to April highs, a violent May crash (leverage flush, China mining ban), a summer range, a new BTC high in November, then decline. Altcoins (SOL especially) went parabolic.

Month by month

Monthly net ($)

How the strategy did — and why

54 trades, 22 winners (41%), net **+$134** — +0.50R per trade, profit factor 1.84. 6 of 12 trading months were profitable.

A good year even in quiet months: the 9 big-move months made +$131 and the 3 near-flat months still added +$3.

Best month **Aug** (+$73); worst **May** (−$19). Longest losing streak: **5** (15 Nov 2021 → 4 Dec 2021, −$25). Max drawdown −$36.

Longs +$138 · shorts −$4. Exits: 12 targets, 31 stops, 11 time exits (averaging +1.02R).

SOLANA (SOL)

2022

Strong downtrend · high volatility

NET	TRADES	WIN RATE	AVG TRADE	MAX DRAWDOWN	LOSING STREAK	COIN MOVE
+$65	**54**	**37%**	**+0.24R**	**−$64**	**6**	**−94%**
$1,164 → $1,228	20 W · 34 L	8 hit the 4R target	PF 1.40	within the year	longest, in trades	volatility 124%

SOL price (log scale) with every trade entry

How the market behaved

Strong downtrend · high volatility. SOL went from $179 to $9.97 (−94%) with annualised volatility of 124% (its typical month: 96%). Trend efficiency of 0.40 means a clean, persistent trend. Price was above its 200-candle SMA 25% of the time and crossed it 76 times; the deepest peak-to-trough fall inside the year was −96%.

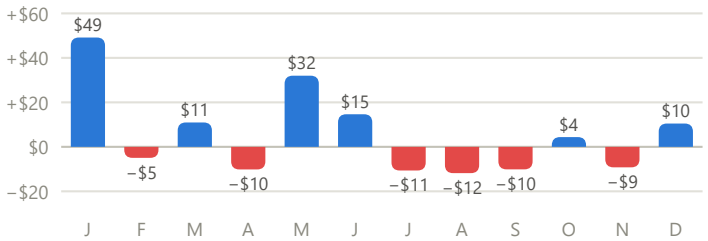

Biggest month up: **Jul** (+25%); biggest month down: **Nov** (−56%).

Backdrop: Bear market: aggressive Fed rate hikes, the LUNA/UST collapse in May, Celsius/3AC in June, and the FTX collapse in November — which hit SOL hardest because FTX/Alameda were major backers.

*2026 to mid-October. 55 of 81 months profitable. Regime labels are measured from the candles: trend efficiency = net move ÷ distance travelled (1 = straight line).

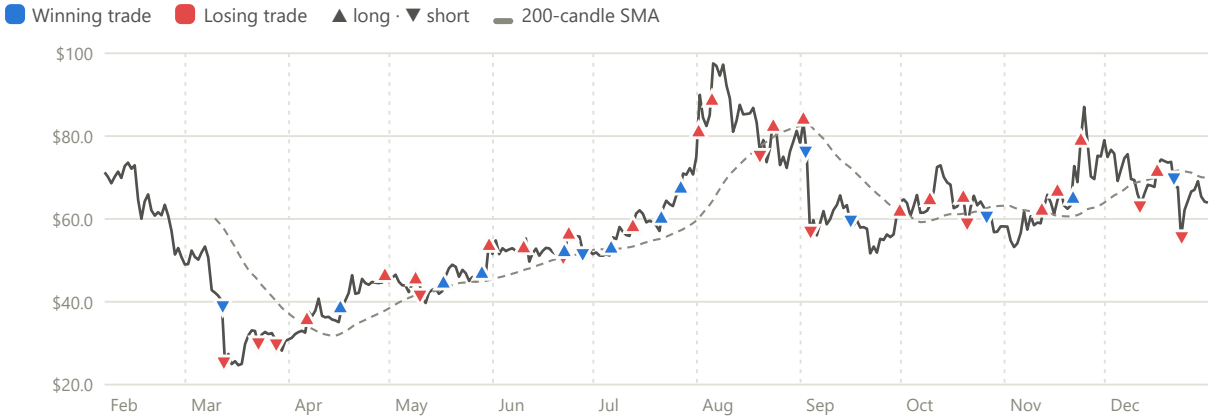

ZCASH (ZEC)

2020 (from listing in Feb)

Sideways / choppy

NET	TRADES	WIN RATE	AVG TRADE	MAX DRAWDOWN	LOSING STREAK	COIN MOVE
+$80	42	33%	+0.38R	−$27	5	−3%
$1,000 → $1,080	14 W · 28 L	9 hit the 4R target	PF 1.64	within the year	longest, in trades	volatility 109%

ZEC price with every trade entry

How the market behaved

Sideways / choppy. ZEC went from $71.2 to $63.9 (−3%) with annualised volatility of 109% (its typical month: 102%). Trend efficiency of 0.02 means mostly a round trip — very choppy. Price was above its 200-candle SMA 56% of the time and crossed it 58 times; the deepest peak-to-trough fall inside the year was −60%.

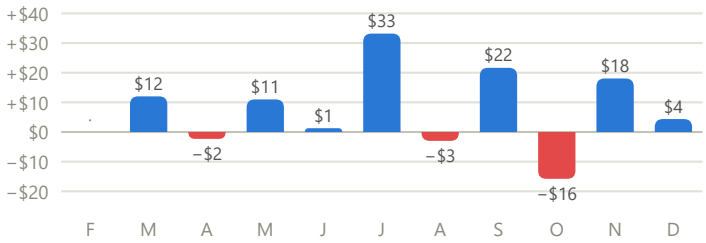

Biggest month up: **Jul** (+46%); biggest month down: **Mar** (−37%).

Backdrop: COVID crash in March (BTC fell ~50% in two days), the May halving, then an institution-led rally from October into year-end.

Monthly net ($)

How the strategy did — and why

42 trades, 14 winners (33%), net **+$80** — +0.38R per trade, profit factor 1.64. 7 of 10 trading months were profitable.

Textbook behaviour: the 8 months where ZEC moved 15% or more made +$98, and the 3 near-flat months (under 10%) cost −$17. The big moves paid for the chop.

Best month **Jul** (+$33); worst **Oct** (−$16). Longest losing streak: **5** (1 Aug 2020 → 2 Sep 2020, −$27). Max drawdown −$27.

Longs +$42 · shorts +$38. Exits: 9 targets, 22 stops, 11 time exits (averaging +0.42R).

ZCASH (ZEC)

2021

Up, but choppy · high volatility

NET	TRADES	WIN RATE	AVG TRADE	MAX DRAWDOWN	LOSING STREAK	COIN MOVE
+$190	**46**	**48%**	**+0.82R**	**−$15**	**3**	**+129%**
$1,080 → $1,270	22 W · 24 L	14 hit the 4R target	PF 2.58	within the year	longest, in trades	volatility 151%

ZEC price (log scale) with every trade entry

How the market behaved

Up, but choppy · high volatility. ZEC went from $56.6 to $146 (+129%) with annualised volatility of 151% (its typical month: 102%). Trend efficiency of 0.09 means mostly a round trip — very choppy. Price was above its 200-candle SMA 56% of the time and crossed it 60 times; the deepest peak-to-trough fall inside the year was −78%.

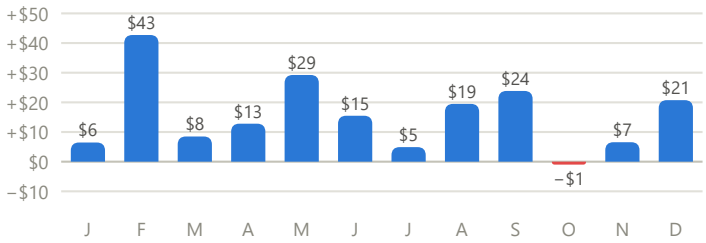

Biggest month up: **Oct** (+56%); biggest month down: **May** (−34%).

Backdrop: Bull-market peak year: a run to April highs, a violent May crash (leverage flush, China mining ban), a summer range, a new BTC high in November, then decline. Altcoins (SOL especially) went parabolic.

GALA price (log scale) with every trade entry

How the market behaved

Strong uptrend · high volatility. GALA went from $0.12 to $0.45 (+297%) with annualised volatility of 223% (its typical month: 98%). Trend efficiency of 0.32 means a fairly directional path. Price was above its 200-candle SMA 44% of the time and crossed it 20 times; the deepest peak-to-trough fall inside the year was −57%.

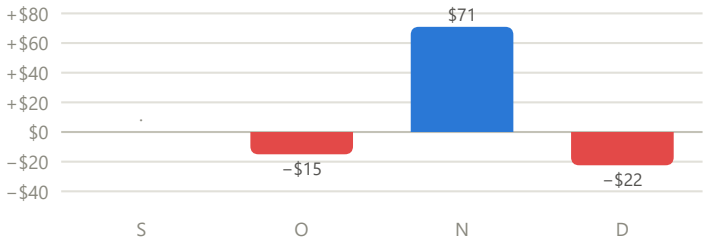

Biggest month up: **Nov** (+550%); biggest month down: **Dec** (−28%).

Backdrop: Bull-market peak year: a run to April highs, a violent May crash (leverage flush, China mining ban), a summer range, a new BTC high in November, then decline. Altcoins (SOL especially) went parabolic.

+$101	**48**	**44%**	**+0.42R**	**−$54**	**5**	**−96%**
$1,033 → $1,134	21 W · 27 L	6 hit the 4R target	PF 1.75	within the year	longest, in trades	volatility 128%

GALA price (log scale) with every trade entry

How the market behaved

Strong downtrend · high volatility. GALA went from $0.46 to $0.02 (−96%) with annualised volatility of 128% (its typical month: 98%). Trend efficiency of 0.50 means a clean, persistent trend. Price was above its 200-candle SMA 17% of the time and crossed it 30 times; the deepest peak-to-trough fall inside the year was −97%.

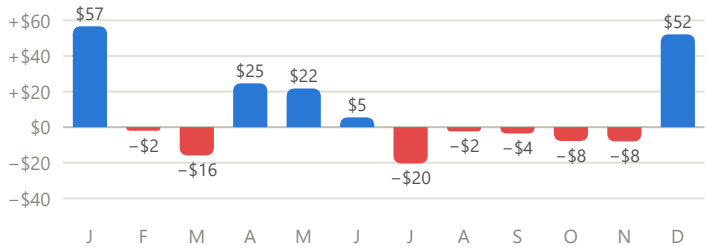

Biggest month up: **Feb** (+32%); biggest month down: **Jan** (−56%).

Backdrop: Bear market: aggressive Fed rate hikes, the LUNA/UST collapse in May, Celsius/3AC in June, and the FTX collapse in November — which hit SOL hardest because FTX/Alameda were major backers.

Month by month

Monthly net ($)

How the strategy did — and why

38 trades, 15 winners (39%), net **+$43** — +0.22R per trade, profit factor 1.40. 6 of 10 trading months were profitable.

A good year even in quiet months: the 6 big-move months made +$34 and the 3 near-flat months still added +$24.

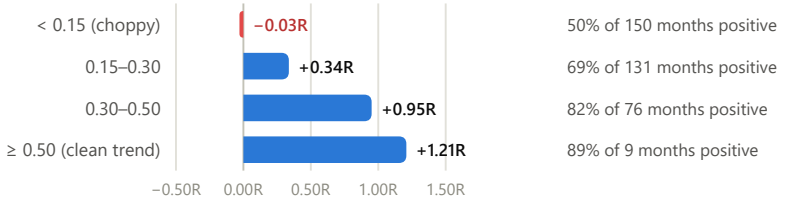

Best month **Jul** (+$31); worst **Oct** (−$15). Longest losing streak: **6** (18 Aug 2026 → 17 Sep 2026, −$27). Max drawdown −$32.

Longs −$3 · shorts +$45. Exits: 5 targets, 20 stops, 13 time exits (averaging +0.74R).

4 · What kind of market does it need?

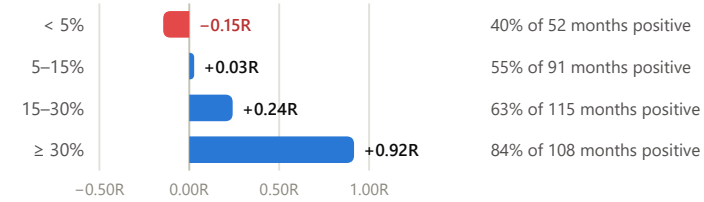

Every month of every coin (366 coin-months with trades), grouped by how the coin behaved that month. Bars show the average result per trade in those months.

Trend efficiency of the month

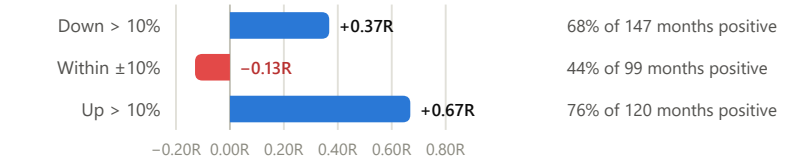

Efficiency = net move ÷ total distance travelled by daily closes. Choppy months (< 0.15) average −0.03R per trade; clean trends (≥ 0.50) average +1.21R.

Size of the coin's move in the month

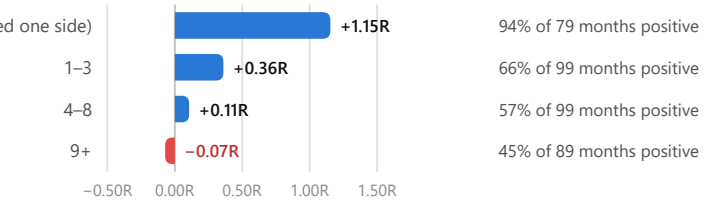

The clearest pattern: months where the coin moved under 5% average −0.15R per trade; 30%+ months average +0.92R.

Direction of the month

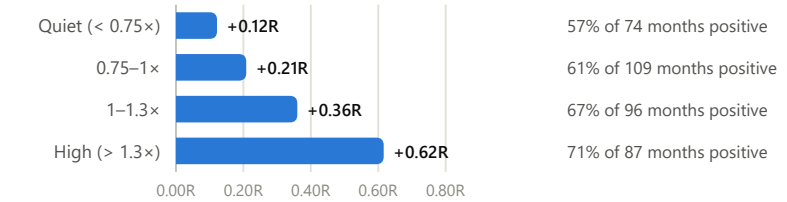

Direction matters little — down months (+0.37R) and up months (+0.67R) both pay. Only the flat middle loses (−0.13R). The SMA filter lets the strategy trade both ways.

How often price crossed the 200-candle SMA

Months that stayed on one side of the SMA made +1.15R per trade (94% profitable). Whipsaw months (9+ crosses) average −0.07R.

Volatility vs the coin's own typical month

Higher volatility helps: high-volatility months average +0.62R per trade vs +0.12R in quiet months.

In one sentence

The strategy needs the coin to **travel a long way in one direction within a few weeks** — up or down. It is hurt most by months that go nowhere: flat, choppy months crossing the trend line again and again, when breakouts fail, reverse and hit the stop at the middle band.

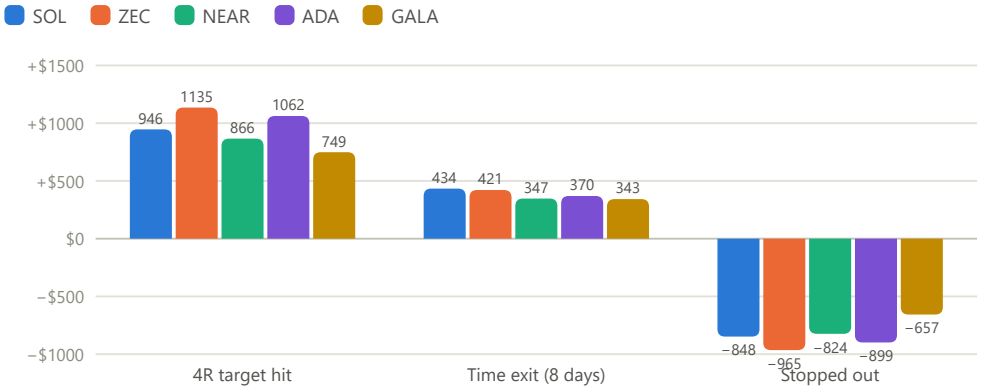

Important: these conditions are measured *after* each month is over. They explain when the strategy makes money, but nobody knows in advance which month will be choppy — section 6 tests whether any of it can be detected at entry.

5 · The 5 coins side by side — why results differ

Profitable months	45 of 74	55 of 81	43 of 73	54 of 82	38 of 62
Max drawdown	−$64	−$78	−$55	−$63	−$54

Where the money comes from (total $, by exit type)

Only 15%–17% of trades reach the target, but they earn ≈ +3.93R each. Time exits average ≈ +0.85R — trades still open after 8 days are usually still moving the right way. Stops cost ≈ −1.03R each.

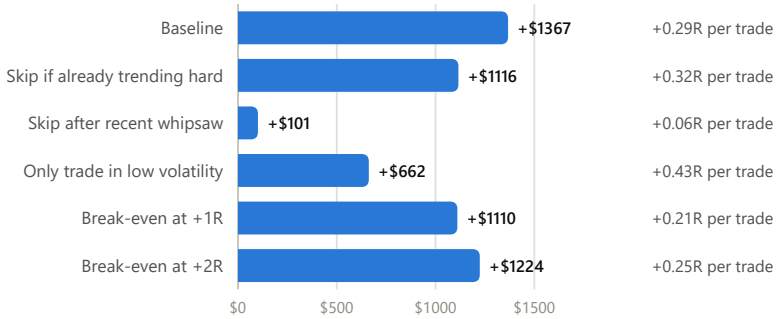

What explains the gap

- **Same payoff shape on every coin** — wins ≈ +2.21R to +2.41R, losses ≈ −0.93R to −0.98R. The difference is **how often breakouts follow through**: win rates run 38%–40%.
- **Volatility and costs:** typical monthly volatility runs from 83% to 110%, and doubling costs removes only 7%–9% of profit on any coin — none is cost-fragile.
- **Long vs short:** GALA made essentially all of its profit on one side (long −$1 / short +$435) — a caution, not a feature. The other coins earn on both sides.
- **Diversification is real:** monthly results barely move together (pairwise correlation 0.00 to 0.32). Combined, the worst drawdown was −$128 vs −$315 if each coin's worst had hit at once.
- **Caution:** NEAR has the smallest edge per trade; GALA has the shortest history and the thinnest market (about $13M a day on Binance when checked in Oct 2026).

6 · What could improve it — ideas tested properly

Each idea was run inside the bot (a skipped signal frees the slot for the next one). Thresholds were set on trades **before 2023** and applied unchanged to **2023→2026, the fair test**.

2023→2026 net profit for each idea (all 5 coins)

Idea	Before 2023 (avg · net)	2023→ (avg · net)	2023→ max DD	Verdict
Baseline	+0.40R · +$1111	+0.29R · +$1367	−$121	—
Skip if the last 10 days already trended hard	+0.45R · +$895	+0.32R · +$1116	−$125	**Better per trade in both halves**, less total profit
Skip after recent whipsaw (many SMA crosses)	+0.34R · +$432	+0.06R · +$101	−$120	Rejected — worse in both
Only trade in low volatility (bottom third)	+0.58R · +$634	+0.43R · +$662	−$108	**Better per trade in both halves**, less total profit
Break-even stop at +1R	+0.26R · +$801	+0.21R · +$1110	−$123	Rejected — worse in both
Break-even stop at +2R	+0.33R · +$943	+0.25R · +$1224	−$118	Rejected — worse in both
Halve risk after 5 losses (sizing)	—	+$1271	−$121	Rejected — less profit, no less drawdown

Facts known at entry vs trade result (low / middle / high third)

Condition at the signal	Before 2023	2023→	Same pattern?
Trend efficiency, last 60 candles (10 days)	+0.50R / +0.49R / +0.21R	+0.47R / +0.18R / +0.22R	Partly
ATR% rank vs the last 90 days	+0.63R / +0.34R / +0.24R	+0.54R / +0.22R / +0.18R	**Yes**
SMA200 slope over 30 candles	+0.35R / +0.56R / +0.25R	+0.40R / +0.32R / −0.03R	Partly
Distance from SMA200 in ATRs (stretch)	+0.31R / +0.54R / +0.36R	+0.25R / +0.44R / +0.17R	Partly
Bollinger band width (% of price)	+0.69R / +0.38R / +0.13R	+0.32R / +0.39R / +0.05R	Partly

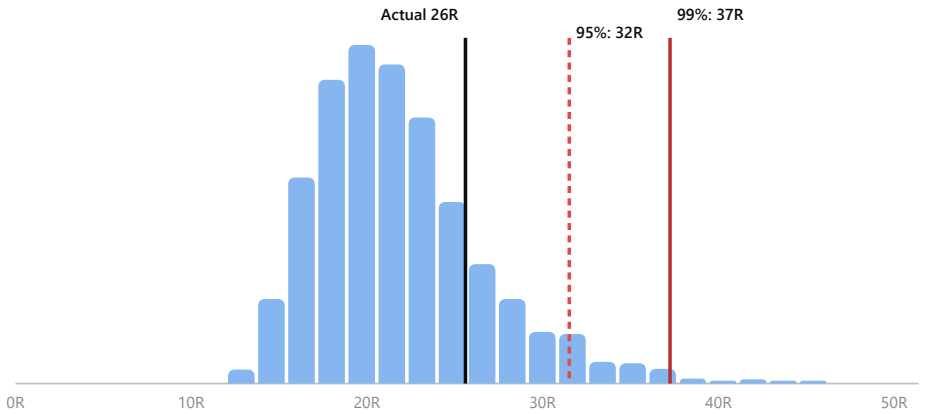

The most consistent signal: the best breakouts start **from compression** — low recent volatility and narrow bands — and the worst come after volatility has already expanded. Five conditions were tried, so one pass could partly be luck.

What this means

- **No filter beat the plain strategy on total profit.** The chop that hurts it is only visible after the fact; trailing proxies remove good trades along with bad ones.
- **Break-even stops hurt** because winners typically dip about −0.39R before working; moving the stop early kills them.
- **Keep the rules frozen.** Two ideas (skip breakouts after a strong 10-day trend; trade only from low volatility) raise the average trade in both halves but cut total profit — "fewer, better trades" options worth paper-trading alongside, not replacing, the baseline.
- **Not yet tested:** letting winners run past 8 days (time exits average +0.85R), a portfolio-level size brake.

7 · Risk planning — what to expect when trading it

How deep could the combined drawdown get? (all 5 coins, in R)

The same 1,508 trades reshuffled into 3,000 random orders. The real history (26R) was on the lucky side of the median (21R) — plan for the 95th percentile. 1R = your risk per trade.

	Actual max DD	Typical (median)	95% worst case	99% worst case	At $1 risk (95%)
SOL	12.8R	13.7R	**21.6R**	26.1R	$22
ZEC	15.6R	14.5R	**22.7R**	27.9R	$23
NEAR	11.1R	15.5R	**24.5R**	30.3R	$25
ADA	12.7R	14.8R	**23.3R**	27.8R	$23
GALA	10.9R	12.3R	**20.6R**	24.8R	$21
All 5	25.6R	21.1R	**31.5R**	37.2R	$32

Expectations at your planned $1 risk per trade

TRADES PER MONTH	EXPECTED PER MONTH	PLAN FOR DRAWDOWN	WIN RATE
19	**$5.9**	**$32**	**39%**
all 5 coins	average, based on 2023→	95% worst case	most trades lose

- Scale is linear: at $5 risk multiply every dollar figure by 5 (drawdown plan ≈ $158).
- A losing streak of 7–9 trades on one coin is **normal** — it happened SOL 2×, ZEC 1×, NEAR 0×, ADA 1×, GALA 2× in six years.
- Recoveries can be slow: ZEC's worst drawdown took 262 days to recover.
- Many individual months lose money (131 of 372 coin-months); judge it over quarters, not weeks.

Stop-and-review triggers (set from this history, not tuned)

- **Drawdown deeper than 37R** across the 5 coins (beyond the 99% case) → stop and re-examine.
- **Rolling 50-trade result below −22R** (worse than the worst 50-trade stretch ever seen) → stop.
- **4R target-hit rate below ~10% over 60+ trades** (history: 15%–17%) → the follow-through the edge depends on has gone.
- Otherwise **do not change the rules** mid-drawdown — every losing stretch in this report recovered without changes.

8 · My take: is this strategy recommended?

Verdict

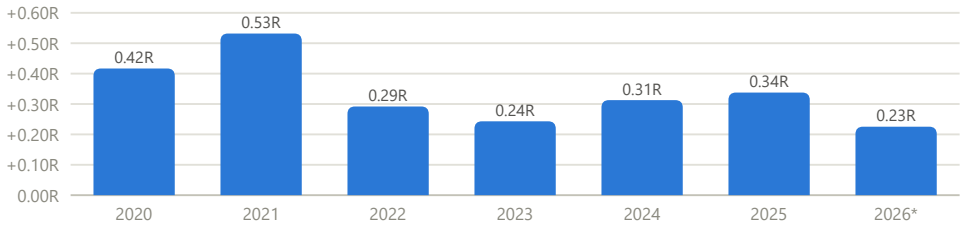

Yes, as a small, rules-only strategy — not as an income source. Across 2020–2026 and 1,508 trades it earned +0.33R per trade after realistic Binance costs and funding, made money on all 5 coins, held up in 2023–26 (never used for tuning), and worked on 4 coins (ZEC, NEAR, ADA, GALA) it had never been tuned on.

It is a classic trend-following breakout: **it does not predict or adapt to the market — it waits for big, clean moves and keeps losses small in between.** That is why it survived the 2021 mania, the 2022 crash and the 2024–26 ranges without a single losing coin-year.

Scorecard

Question	Answer	Evidence
Profitable after realistic costs?	**Yes**	+$2479 over 2020–26; still +$2285 with double costs
Works outside its tuning data?	**Yes**	+$1345 in 2023→; ZEC, NEAR, ADA, GALA never tuned: +$1946
Free of look-ahead / repainting?	**Yes**	0 mismatches in 500 truncation tests
Consistent across regimes?	**Mostly**	34 of 34 coin-years positive or flat; chop costs money
Adapts to changing markets?	**No**	No filter tested improved total profit
Edge decaying?	**Somewhat**	+0.40R per trade before 2023 vs +0.29R after
Easy to sit through?	**No**	39% win rate, 7–9 loss streaks, long recoveries

Is the edge holding up? Average result per trade, by year (all 5 coins)

2026 to mid-October. 2021 was the strongest year (+0.53R per trade) and 2026 the weakest (+0.23R). Before 2023 the average trade was +0.40R vs +0.29R after — some of the early edge has faded.

Recommended setup

- **Coins:** all 5 at equal size to start, GALA at half size until it has live results — shortest history, thinnest market, and all its profit comes from shorts.
- **Rules:** exactly as tested — Bollinger 20/2σ, SMA200 filter, stop at the middle band, **4R target**, 48-candle time exit.
- **Risk:** start at **$1 per trade**. Plan for a ≈$32 drawdown; expect about $5.9 a month on average (many single months will be negative).
- **Execution:** place the target as a resting limit order (maker fee) and the stop at entry; never move the stop early.
- **Review:** log every trade and compare with this report each month; use the stop triggers on the previous page.

Proven vs still a hypothesis

Supported by the data

- Profitable on SOL, ZEC, NEAR, ADA, GALA after costs and funding
- Big clean moves (either direction) pay; flat months lose
- Edge per trade ranges from +0.26R (NEAR) to +0.36R (GALA)
- Coins are only weakly correlated — combined drawdown −$128 vs −$315 if each coin's worst hit together
- Break-even stops and whipsaw filters make it worse

Needs more testing

- That the edge continues — the 4R target was picked with hindsight
- Coin choice: these 5 were picked from ~100 screened because they did best
- Skipping breakouts after a strong 10-day trend (better per trade, less total)
- Low-volatility-only trading (better per trade in both halves, but 52% less profit)
- Letting winners run past 8 days
- Why GALA works only on the short side

Backtests describe the past. Past results — even carefully tested, out-of-sample ones — do not guarantee future returns. Trade only money you can afford to lose.
